Abstract

The recent discovery of the minor isotopomer of ethane, $^{13}C^{12}CH_6$, in the planetary atmospheres of Jupiter and Neptune, added ethane to the molecules which can be used to determine isotopic $^{12}C/^{12}C$ ratios for the jovian planets. The increased spectral resolution and coverage of the IR and far–IR instruments to be carried on the Cassini mission to Saturn and Titan may enable the detection of the minor isotopomer. Accurate frequency and cross–section measurements of the ν_{12} fundamental under controlled laboratory condition are important to interpret current and future planetary spectra. High resolution spectra of the minor isotopomer $^{13}C^{12}CH_6$ have been recorded in the 12.2 μm region using the Kitt Peak Fourier Transform (FTS) and the Goddard Tunable Diode Laser spectrometer (TDL). In a global fit to 19 molecular constants in a symmetric top Hamiltonian, transition frequencies of the ν_{12} fundamental ranging up to $J = 35$ and $K = 20$ have been determined with a standard deviation of less than 0.0005 cm^{-1}. From selected line intensity measurements, a vibrational dipole moment for the ν_{12} fundamental has been derived. Observed and calculated spectra covering the region from 740cm^{-1} to 910cm^{-1} are presented. A compilation of transition frequencies, line intensities, and lower state energies are included for general use in the astronomical community.

PRECEDING PAGE BLANK NOT FILMED

Introduction

The current spectroscopic study of the minor isotopomer $^{13}C^{12}CH_6$ is motivated by its recent discovery as a constituent in the atmosphere of Jupiter by Wiedemann *et al.(1)*. Employing a cryogenic echelle array spectrometer, Orton *et al.(2)* identified traces of ^{13}C–ethane in Neptune's atmosphere. In both cases a near–terrestrial isotopic $^{12}C/^{13}C$ ratio has been found*(1,2)*. Laboratory measurements of frequencies and intensities are important for future identification and atmospheric modeling of $^{13}C^{12}CH_6$ in the outer planetary atmospheres using for instance high resolution heterodyne remote sensing.

Regular ethane and its deuterated species have been studied in some detail in the mid– and far–infrared*(3–9)*. The minor isotopomer $^{13}C^{12}CH_6$ has been investigated in the 2700 cm^{-1} region of the $\nu_3 + \nu_4$ overtone (equivalent to $\nu_2 + \nu_6$ in normal ethane) by Lafferty *et al.(10)*. More recently, in studies of the 12μm region Kurtz *et al.(11)* obtained the ratio of the integrated intensity of the ^rQ_o–branch of the ν_{12} band of $^{13}C^{12}CH_6$ with respect to the equivalent ν_9 band of normal ethane. These studies were based on high resolution (0.0025 cm^{-1}) data recorded with the 1 m McMath FTS instrument at the National Solar Observatory in Kitt Peak, Arizona. The same laboratory data have been analyzed to assign rotation–torsional transitions in the ν_{12} fundamental and to determine ground state rotational constants from lower state combination differences *(12)*.

More recently, the analysis has been extended to determine upper state constants for the ν_{12} fundamental of the minor isotopomer and to derive barriers to internal rotation in the ground and vibrational excited state *(13)*. In this publication, a complete line by line compilation of calculated frequencies, lower state energies, and line strengths are published. From the molecular parameters a spectral atlas has been produced covering the region from 740 to 910 cm^{-1}.

Experimental Details

Several spectra at room and typical planetary temperatures (101K and 161K) were recorded using the 1–m Fourier transform spectrometer at the Kitt Peak National Solar Observatory*(11,12)*. This instrument was operated in a double–pass configuration yielding a spectral resolution of 0.0025 cm^{-1}*(14)*. The $^{13}C^{12}CH_6$ sample was provided in a 99% purified form by Matheson Co. No traces of the major isotopomer have been found in the unapodized FTS spectra. Calibration to absolute wavenumbers was done using well–isolated P– and R–branch lines of the ν_2^{1e} and $2\nu_2^{0e}$ band of N_2O at 580 cm^{-1} and 1168 $cm,^{-1}$ respectively*(12)*.

Details of the tunable diode laser system at NASA Goddard Space Flight Center can be found in Ref. *(15)*. Several Q–branches ranging from $K\Delta K = -6$ to 6 were measured to obtain complementary information on observed torsional splittings *(13)*. These spectra were recorded with gas pressures of $p = 1.5$ Torr and an absorption cell length of $\ell = 30$ cm. Relative wavenumber calibrations were obtained using a 3 inch solid Ge–etalon (0.01623 cm^{-1} fringe spacing). A total of 68 splittings from the diode laser observations (Table II)

Table I. *Molecular constants of* $^{13}C^{12}CH_6$ *in* cm^{-1}. C_σ is the torsional Coriolis interaction parameter connecting the $v_{12} = 1$ state with the $v_6 = 3$ state. σ_F is the weighted standard deviation of the overall fit. 2307 transitions and torsional splitting values survived the fit. For convenience parameters are also given in Hz.

were added to the FTS data in the global fit to determine molecular constants for ν_{12}.

Global Least Squares Fit

An iterative bi–weighted non–linear least squares fit of the upper and lower state energies has been carried out simultaneously. The upper state Hamiltonian included off–diagonal ℓ–resonance terms within the $v_{12} = 1$ state and off–diagonal torsional Coriolis interaction terms connecting with the excited torsional state of $v_6 = 3$. The results of the global fit are summarized in Table I *(13)*. A more detailed account of the fitting procedure and the Hamiltonian used can be found in Ref. *(13)*.

Of the 21 parameters employed in the upper and lower state Hamiltonian, the rotational constants A_o and D_o^K have been fixed to 2.66852 cm^{-1} *(9)* and 9.54×10^{-6} cm^{-1} *(16)*, respectively. The rotation–torsional constants F_{1J} and F_{1K} in the $v_{12} = 1$ state were fixed to the ground state value. Observed torsional splittings recorded with the TDL spectrometer have been weighted by an extra factor of 4 corresponding to the enhancement in spectral resolution over the FTS data.

The intrinsic and unperturbed torsional splitting between the components of the torsional doublets as calculated from the upper and lower state barriers is 1.53×10^{-3} cm,$^{-1}$ which is not resolved in the current FTS data. For $K = 3n$ transitions with relative intensities of 2:1, both peaks of the doublets can be measured from the FTS data if they are separated by more than about 4.5×10^{-3} cm^{-1} and for $K \neq 3n$ (4:1 relative intensities) by more than 7.0×10^{-3} cm.$^{-1}$ Therefore, most torsional doublets could not be resolved, except near the crossing region which occurs at $K\Delta K = -18$. Most transition frequencies, particularly in the R–branches ($\Delta K = 1$) and as J approaches K, represent rather an average of the doublets. In order to avoid "frequency pulling" *(5)*, transition frequencies of the $K = 3n$ series have been calculated using a weighted average of the two calculated frequencies of the doublets. The weights were chosen according to their statistical weights. Simulated spectra showed that such a weighting scheme yields a good approximation. In cases where one of the components of the doublets is rather weak, the average of the frequencies tends to be closer to the frequency of the strong component and therefore observed frequencies of unresolved $K \neq 3n$ torsional doublets (with 4:1 relative intensity ratio) have been assigned to the stronger component of the doublet.

Intensity Analysis

Forty–two individual lines of the ν_{12} band observed with the FTS have been measured to retrieve their intensities. Only those lines whose torsional components were sufficiently separated (mostly ${}^pP_K(J)$ lines) permitting a measurement of both components were included in the analysis. Since the intensity retrieval is constrained to a limited region, no attempts were made to determine the F–factors. Some of the very weak intensities have been discarded if their peak strength was below 10%. The lines were fitted to a convolution

$R_v^2 = 7.45(29) \times 10^{-4}$ (Debye)^2

$S_{\text{band}} = \sum_i S_i = 15.93(62)$ cm^{-2}atm^{-1}@294K

of a Doppler spectrum in absorption with an appropriate FTS instrument function whose amplitude modulation function of the interferogram is a cosine truncated by the length of the mirror scan*(17)*.

The retrieved intensities (Table III) were subjected to a least squares fit to the usual equation

$$S_i = \frac{8\pi^3}{3hc}\frac{L_o T_o}{T p_o}\gamma_a \, g_{JK} \frac{\exp(-E''_{vrt}/kT)}{Q_v Q_r Q_t}\left[1 - \exp\left(-\frac{hc\nu_i}{kT}\right)\right] L_r R_v^2 W_i, \qquad (1)$$

where S_i is the line intensity in units of cm^{-2}atm;$^{-1}$ h Planck's constant; k the Boltzmann

constant; c the speed of light; L_o Loschmidt's number at standard temperature T_o=273.15 K and pressure p_o=1 atm; T the ambient temperature; E''_{vrt} the lower state energy, and Q_v, Q_r, and Q_t are the vibrational, rotational, and torsional partition function, respectively. γ_a is the isotopic abundance of the species which equals 1 for a purified sample.

The last three terms in Eq. (1) represent the effective square dipole moment, where R_v^2 is the square vibrational transition moment and L_r the Hönl-London factor*(18)*. The perturbation factor W_i is a correction factor to the rigid–rotor intensity caused by combined ℓ–resonance within the $v_{12} = 1$ state and the torsional Coriolis interaction between $v_{12} = 1$ and $v_6 = 3$. These factors have been calculated by transforming the rotational transition moment matrix using the unitary eigenvector matrix which also diagonalizes the upper state Hamiltonian. Values for W_i are obtained after squaring and normalizing to the square rotational transition moment L_r in the unperturbed limit. Due to the mixing effects, ${}^pP$, ${}^rQ$, and ${}^pR$ type transitions are enhanced in their intensities, while ${}^rP$, ${}^pQ$, and ${}^rR$ transitions are depleted.

The partition functions at T=294 K were calculated to be: $Q_r = 18,613$, $Q_v = 1.058$, and Q_t=4.063. The fitted square vibrational dipole moment was $R_v^2 = 7.45(29) \times 10^{-4}$ D^2, which is about 11% less than the value derived from the major isotopomer*(5)*. This result is also in agreement with earlier analysis of the integrated strength of the ${}^rQ_o$ branch*(11)*.

The Line Atlas

In Appendix A calculated line parameters for transitions of the ν_{12} fundamental are listed. The line parameters for each transition are the rotational quantum numbers $J, K, \Delta K$, and ΔJ and the torsional quantum number σ, calculated frequency ν_i in cm^{-1}, observed minus calculated frequency (o–c) given in the last digits, lower state (ground state) energy E_i in cm^{-1}, line intensity in cm^{-2}atm^{-1}@296K, and the perturbation factor W_i. Line parameters have been calculated up to $K = 20$ and $J = 35$. The intensities have been converted from 294 K to the standard temperature $T = 296$ K using the exact expression in Eq. (1). For general conversion to other temperatures, for instance planetary temperatures, values for the torsional partition function have been calculated in the range of 100 K to 400 K using a ground state torsional barrier height of 1026.88cm^{-1} (Table IV).

The observed FTS spectrum of $^{13}C^{12}CH_6$ is shown in Appendix B. The experimental conditions were $p = 1.05$ Torr, $\ell = 150$ cm, and T =294 K. Below the observed spectrum in each panel the calculated spectrum under the same experimental condition is shown in two ways, first on a scale from 0% to 100% transmission and, secondly, from 90% to 100% transmission. The calculated Doppler spectra has been properly convolved with an appropriate instrumental profile as outlined as follows.

The approximate FTS apparatus function in interferogram space due to the aperture

Table IV. *The torsional partition function Q_t as a function of temperature T.*

T [K]	Q_t	T [K]	Q_t	T [K]	Q_t
100	3.049	200	3.456	300	4.105
110	3.072	210	3.513	310	4.178
120	3.100	220	3.572	320	4.251

150	3.209	250	3.761	350	4.477
160	3.252	260	3.827	360	4.553
170	3.299	270	3.895	370	4.631
180	3.349	280	3.964	380	4.709
190	3.401	290	4.034	390	4.787
		296	4.077	400	4.866

effect can be written as *(17)*

$$A(\delta) = \cos\left(b\frac{\delta}{L}\right); \qquad |\delta| \leq L, \tag{2}$$

where δ is the optical path difference in the two arms of the interferometer and L the maximum optical path difference. The form of Eq. (2) introduces a self-apodization in the observed spectra. The Fourier transform of $A(\delta)$ is then given by

$$\begin{aligned} A(\nu) &= L\left\{\frac{\sin(2\pi\nu L + b)}{2\pi\nu L + b} + \frac{\sin(2\pi\nu L - b)}{2\pi\nu L - b}\right\} \\ &= L\left\{\mathrm{sinc}(2\pi\nu L + b) + \mathrm{sinc}(2\pi\nu L - b)\right\} \end{aligned} \tag{3}$$

The parameters used were $L = 173$ cm and $b = 0.818$ as determined from a least squares fit of the line profiles. This apparatus function was convolved with a calculated Doppler spectrum to simulate the observed FTS spectra, i.e. the normalized transmission τ at frequency ν is

$$\tau(\nu) = \int_{-\infty}^{\infty} d\nu'\, A(\nu' - \nu)\, \exp\left(-\sum_i S_i\, f(\nu' - \nu_i)x\right) \tag{4}$$

S_i is the line strength of the transition at frequency ν_i, $x = p\ell$ the optical density, and $f(\nu - \nu_i)$, the unit area line profile, here a Doppler profile. The convolution integral has been calculated by numerical summation with proper truncation to a finite sum of

intensities, the apparatus function, and line shapes in the far wing.

The spectra shown in Appendix B extends from 740cm^{-1} to 910cm^{-1}. The top spectrum shows the observed FTS spectrum, the middle and bottom trace the calculated spectrum in different scales. Observed lines which do not appear in the calculated spectra belong either to the $\nu_6 + \nu_{12} \leftarrow \nu_6$ vibration–torsional hotband, which is equivalent to the $\nu_4 + \nu_9 \leftarrow \nu_4$ band of normal ethane, or are outside the range of calculated quantum numbers.

Appendix A

Table of Calculated ν_{12} Transitions of $^{13}C^{12}CH_6$

Legend:

K, J	Lower state rotational quantum number, i.e. $K,''$ J''
$\Delta K, \Delta J$	Difference in rotational quantum number of upper and lower state, i.e. $\Delta K = K' - K,''$ $\Delta J = J' - J.''$ The ℓ quantum number of the upper state can be deduced from the selction rules $\Delta K = \Delta \ell$
σ	Torsional quantum number with selection rule $\Delta \sigma = 0$
ν_i	Calculated transition frequency in cm^{-1}
o–c	Observed minus calculated frequency in the last five digits. Transitions marked with an asterisk (*) were excluded from the global fit
E_i''	Lower state energy in cm^{-1}
S_i	Line intensity in $cm^{-2}atm^{-1}@296K$
W_i	Intensity perturbation factor (dimensionless)

Appendix B

Observed and Calculated FTS Spectra of ν_{12} $^{13}C^{12}CH_6$

Top trace:

Observed at $p = 1.05$ Torr, ℓ=1.5 m and $T = 294$ K.

Middle trace:

Calculated at $p = 1.05$ Torr, ℓ=1.5 m and $T = 294$ K. Spectrum shown on a scale from 0% to 100% transmission.

Bottom trace:

Same as middle trace. Spectrum shown on a blown up scale from 90% to 100% transmission.

OMB No. 0704-0188

Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302, and to the Office of Management and Budget, Paperwork Reduction Project (0704-0188), Washington, DC 20503.

13. ABSTRACT *(Maximum 200 words)*

The recent discovery of the minor isotopomer of ethane, $^{13}C^{12}CH_6$, in the planetary atmospheres of Jupiter and Neptune, added ethane to the molecules which can be used to determine isotopic $^{12}C^{12}C$ ratios for the jovian planets. The increased spectral resolution and coverage of the IR and far-IR instruments to be carried on the Cassini mission to Saturn and Titan may enable the detection of the minor isotopomer. Accurate frequency and cross-section measurements of the ν_{12} fundamental under controlled laboratory condition are important to interpret current and future planetary spectra. High resolution spectra of the minor isotopomer $^{13}C^{12}CH_6$ have been recorded in the 12.2 μm region using the Kitt Peak Fourier Transform (FTS) and the Goddard Tunable Diode Laser spectrometer (TDL). In a global fit to 19 molecular constants in a symmetric top Hamiltonian, transition frequencies of the ν_{12} fundamental ranging up to J=35 and K=20 have been determined with a standard deviation of less than 0.0005 cm^{-1}. From selected line intensity measurements, a vibrational dipole moment for the ν_{12} fundamental has been derived. Observed and calculated spectra covering the region from 740cm^{-1} and to 910cm^{-1} are presented. A compilation of transition frequencies, line intensities, and lower state energies are included for general use in the astronomical community.

NASA SCIENTIFIC AND TECHNICAL DOCUMENT AVAILABILITY AUTHORIZATION (DAA)

To be initiated by the responsible NASA Project Officer, Technical Monitor, or other appropriate NASA official for all presentations, reports, papers, and proceedings that contain scientific and technical information. Explanations are on the back of this form and are presented in greater detail in NHB 2200.2, "NASA Scientific and Technical Information Handbook."

☒ Original ☐ Modified

(Facility Use Only)
Control No. _____
Date _____

I. DOCUMENT/PROJECT IDENTIFICATION (Information contained on report documentation page should not be repeated except title, date and contract number)

Title: A SPECTRAL ATLAS OF THE ν_{12} FUNDAMENTAL OF $^{13}C^{12}CH_6$ IN THE 12 μM REGION

Author(s): MARK WEBER, DENNIS REUTER, MARCOS SIROTA, WILLIAM BLASS, JOHN HILLMAN

Originating NASA Organization: / NASA-GSFC, CODE 693

Performing Organization (if different) _____

Contract/Grant/Interagency/Project Number(s) _____

Document Number(s) _____

(For presentations or externally published documents, enter appropriate information on the intended publication such as name, place, and date of conference, periodical or journal title, or book title and publisher: _____ Document Date: _____

These documents must be routed to NASA Headquarters, International Affairs Division for approval. (See Section VII))

II. AVAILABILITY CATEGORY

Check the appropriate category(ies):

Security Classification: ☐ Secret ☐ Secret RD ☐ Confidential ☐ Confidential RD ☒ Unclassified

IN-72
8494
179P

Export Controlled Document - Documents marked in this block must be routed to NASA Headquarters International Affairs Division for approval.
☐ ITAR ☐ EAR

NASA Restricted Distribution Document
☐ FEDD ☐ Limited Distribution ☐ Special Conditions-See Section III

Document disclosing an invention
☐ Documents marked in this block must be withheld from release until six months have elapsed after submission of this form, unless a different release date is established by the appropriate counsel. (See Section IX).

Publicly Available Document
☐ Publicly available documents must be unclassified and may not be export-controlled or restricted distribution documents.
☐ Copyrighted ☒ Not copyrighted

III. SPECIAL CONDITIONS

Check one or more of the applicable boxes in each of (a) and (b) as the basis for special restricted distribution if the "Special Conditions" box under NASA Restricted Distribution Document in Section II is checked. Guidelines are provided on reverse side of form.

a. This document contains:
☐ Foreign government information ☐ Commercial product test or evaluation results ☐ Preliminary information ☐ Information subject to special contract provision
☐ Other—Specify _____

b. Check one of the following limitations as appropriate:
☐ U.S. Government agencies and U.S. Government agency contractors only ☐ NASA contractors and U.S. Government agencies only ☐ U.S. Government agencies only
☐ NASA personnel and NASA contractors only ☐ NASA personnel only ☐ Available only with approval of issuing office; _____

IV. BLANKET RELEASE (OPTIONAL)

All documents issued under the following contract/grant/project number _____ may be processed as checked in Sectons II and III.

The blanket release authorization granted _____ (Date) is:

☐ Rescinded - Future documents must have individual availability authorizations. ☐ Modified - Limitations for all documents processed in the STI system under the blanket release should be changed to conform to blocks as checked in Section II.

V. PROJECT OFFICER/TECHNICAL MONITOR

X DRAKE DEMING — Typed Name of Project Officer/Technical Monitor | 693 — Office Code | Drake Deming — Signature | 4-7-94 — Date

VI. PROGRAM OFFICE REVIEW

☒ Approved ☐ Not Approved

X JOSEPH ALEXANDER — Typed Name of Program Office Representative | _____ — Program Office and Code | _____ — Signature | 4/8 — Date

VII. INTERNATIONAL AFFAIRS DIVISION REVIEW

☐ Open, domestic conference presentation approved.
☐ Foreign publication/presentation approved.
☐ Export controlled limitation is approved.
☐ Export controlled limitation is not applicable.
☐ The following Export controlled limitation (ITAR/EAR) is assigned to this document: _____

_____ International Affairs Div. Representative | _____ Title | _____ Date

VIII. EXPIRATION OF REVIEW TIME

The document is being released in accordance with the availability category and limitation checked in Section II since no objection was received from the Program Office within 20 days of submission, as specified by NHB 2200.2, and approval by the International Affairs Division is not required.

Name & Title _____ Office Code _____ Date _____

Note: This release procedure cannot be used with documents designated as Export Controlled Documents, conference presentations or foreign publications.

IX. DOCUMENTS DISCLOSING AN INVENTION

a. This document may be released on _____ (Date) Installation Patent or Intellectual Property Counsel _____ Date _____

b. The document was processed on _____ (Date) in accordance with Sections II and III as applicable. NASA STI Facility _____ Date _____

X. DISPOSITION

Completed forms should be forwarded to the **NASA Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240**, with either (check box):

☐ Printed or reproducible copy of document enclosed

☐ Abstract or Report Documentation Page enclosed. The issuing or sponsoring NASA installation should provide a copy of the document, when complete, to the NASA Scientific and Technical Information Facility at the above listed address.
